Runway 05 PBN Arrival PBN and Vectoring

This scenario would see the availability of PBN arrivals but with the ability for ATC to still vector arrivals when required to provide the required final approach sequence and spacing.

The PBN arrival(s) would likely be the 'best performing' of Options A-D above which are then optimised in Stage 3 to balance CO₂, noise impacts and Controlled Airspace containment requirements. The frequency of usage of the PBN route(s) would need to be determined through stakeholder engagement and consultation.

Runway 23 PBN Arrival PBN and Vectoring

This scenario would see the availability of PBN arrivals but with the ability for ATC to still vector arrivals when required to provide the required final approach sequence and spacing.

The PBN arrival(s) would likely be the 'best performing' of Options above which are then optimised in Stage 3 to balance CO₂, noise impacts and Controlled Airspace containment requirements. The frequency of usage of the PBN route(s) would need to be determined through stakeholder engagement and consultation.

Runway 05 Departure Option F (Split Left and Right)

This option shares NORBO traffic between a left and right turn with only one of those routes in use at a time. The rest of the routes remain in the same configuration.

When turning left, the NORBO would offset left then turn further left at 1nm

When turning right, the NORBO would go straight ahead to 2nm then a right turn

Assumes the NORBO route switches at a point each day/night to enable a 50/50 route utilisation.

Runway 05 Departure Option G (Period 1 and Period 2)

This option has two, quite different route configurations and assumes one configuration would be used for the peak departure period each morning. The configuration would then switch for the rest of the day.

In the morning, the NORBO traffic is shared between a left turn departure and a right turn departure with both routes available at the same time.

For the rest of the day, all the NORBO traffic would then use a single flight path turning right, but that path could be different to the one used for the morning.

Runway 23 Departure Option A

Offset right departures with turns at 2nm and 7nm from the runway.

Offset left departures with turns at 1nm from the runway.

NORBO traffic is shared between a left turn departure route and the departure route that offsets right and then turns left at 7nm with both routes available at the same time.

Runway 23 Departure Option C

This option has two, slightly different route configurations and assumes one configuration would be used for the peak departure period each morning. The configuration would then switch for the rest of the day.

In the morning, the NORBO traffic is shared between an offset left turn departure and an offset right turn departure with both routes available at the same time.

For the rest of the day, all the NORBO traffic would then use different flight path which offsets to the left, with the rest of the routes remaining the same.

Runway 23 Departure Option D

This option has two, slightly different route configurations and assumes one configuration would be used for the peak departure period each morning. The configuration would then switch for the rest of the day.

In the morning, the NORBO traffic is shared between an offset left turn departure and an offset right turn departure with both routes available at the same time.

For the rest of the day, all the NORBO traffic would then use a different flight path which follows a straight line from the runway until splitting at 5nm, with the rest of the routes remaining the same.

This option is similar to Option C except that the daytime (non-peak) NORBO route is different.
