
Southampton Airport

FASI-S Airspace Change Proposal

Initial Options Appraisal

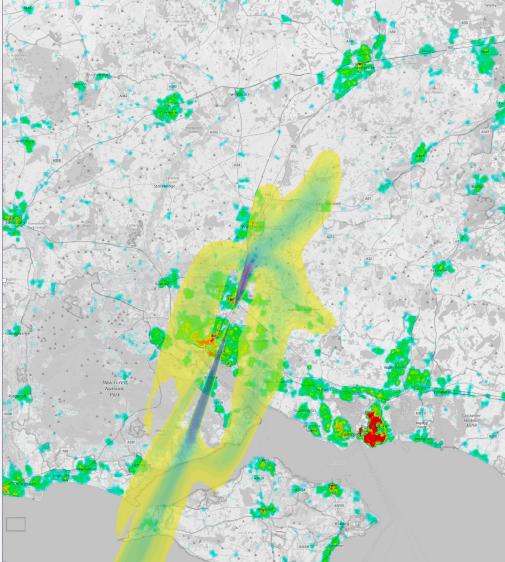

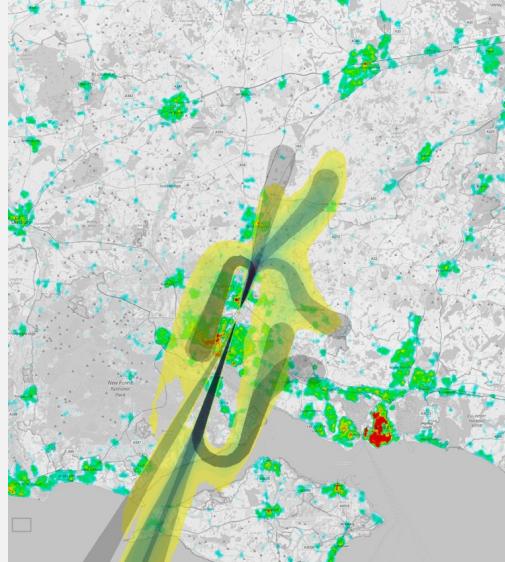

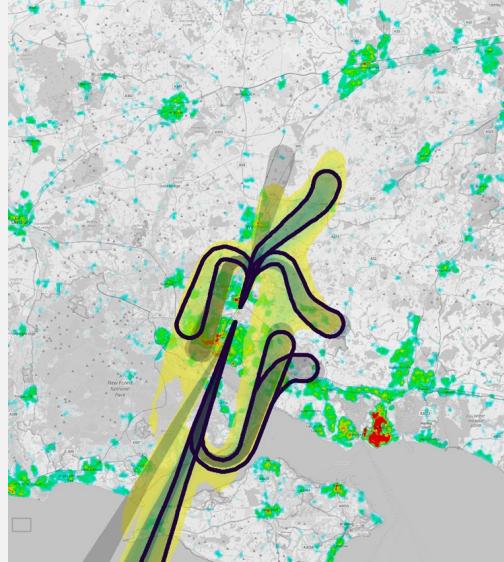

Technical Appendix B

Methodology Overview

For more information around the methodology, please see our Stage 2B Initial Options Appraisal document on the [CAA's Airspace Change Portal](#).

Data within this Technical Appendix - Overview of Methodology

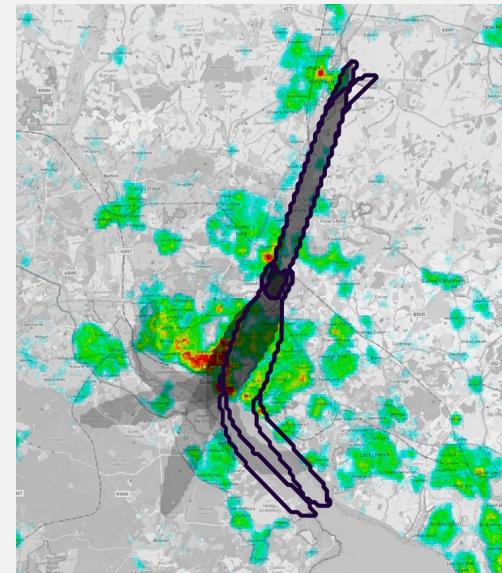

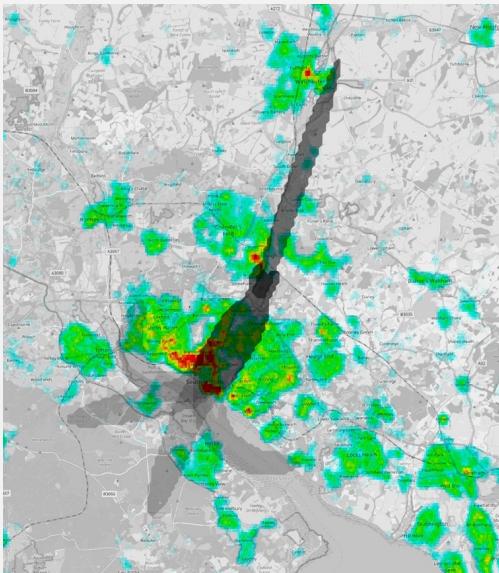

Heatmap Baseline (0-7000ft)	Baseline Centerline Overflight Contours (0-7000ft)	Option Overflight (0-7000ft)
<p>Based on actual 2022 NTK 92 day data therefore shows a typical vectoring swathe.</p> <p>Use the CAA's definition of overflight (48.5 degree)</p> <p>Not based on the optioneering tool therefore the data reflects the climb and descent profiles of the full Southampton fleet mix</p> <p>Presented with population density data</p> 	<p>Based on a single noise event i.e one departure or arrival based on the A320 profile in AEDT using the CAA's definition of overflight.</p> <p>Southampton does not have published departure or arrival routes beyond the noise abatement procedures and so the typical centrelines have been estimated based on NTK data, known waypoints and ATC input. The contours <u>do not</u> consider frequency of overflight.</p> <p>Baseline average centerline data has been generated in order to offer an initial comparison between the baseline typical centerline's and the option's overflight contours. The data tables use 2021 CACI and point X data to identify noise sensitive sites and population.</p> 	<p>Provides a comparison between the overflight contour of an option (shown with black outline), the vectoring heatmap, and the average baseline centreline data (shaded grey).</p> <p>Average baseline centreline (shaded grey) and option overflight contour (black outline) based on a single overflight event based on a single noise event i.e one departure or arrival based on 'A320' profile in AEDT using the CAA's definition of overflight. The contours do not consider the frequency of overflight or the system as a whole.</p> 

Methodology Overview

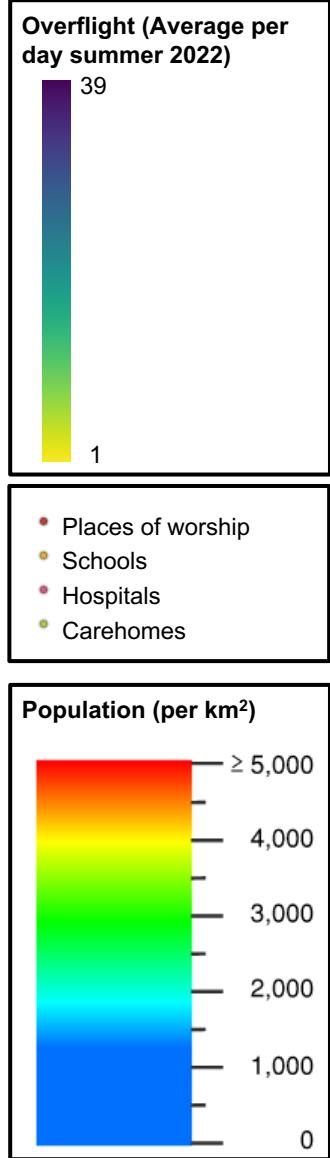

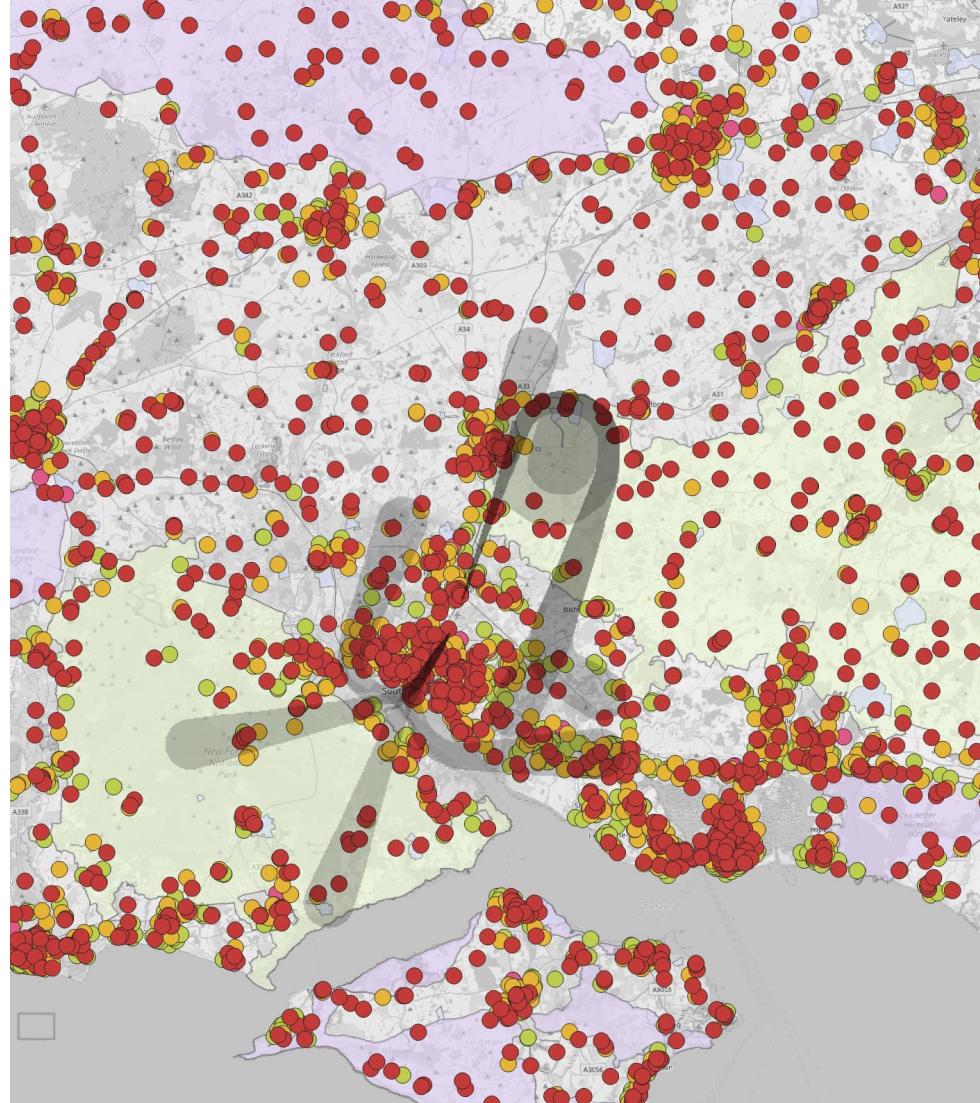

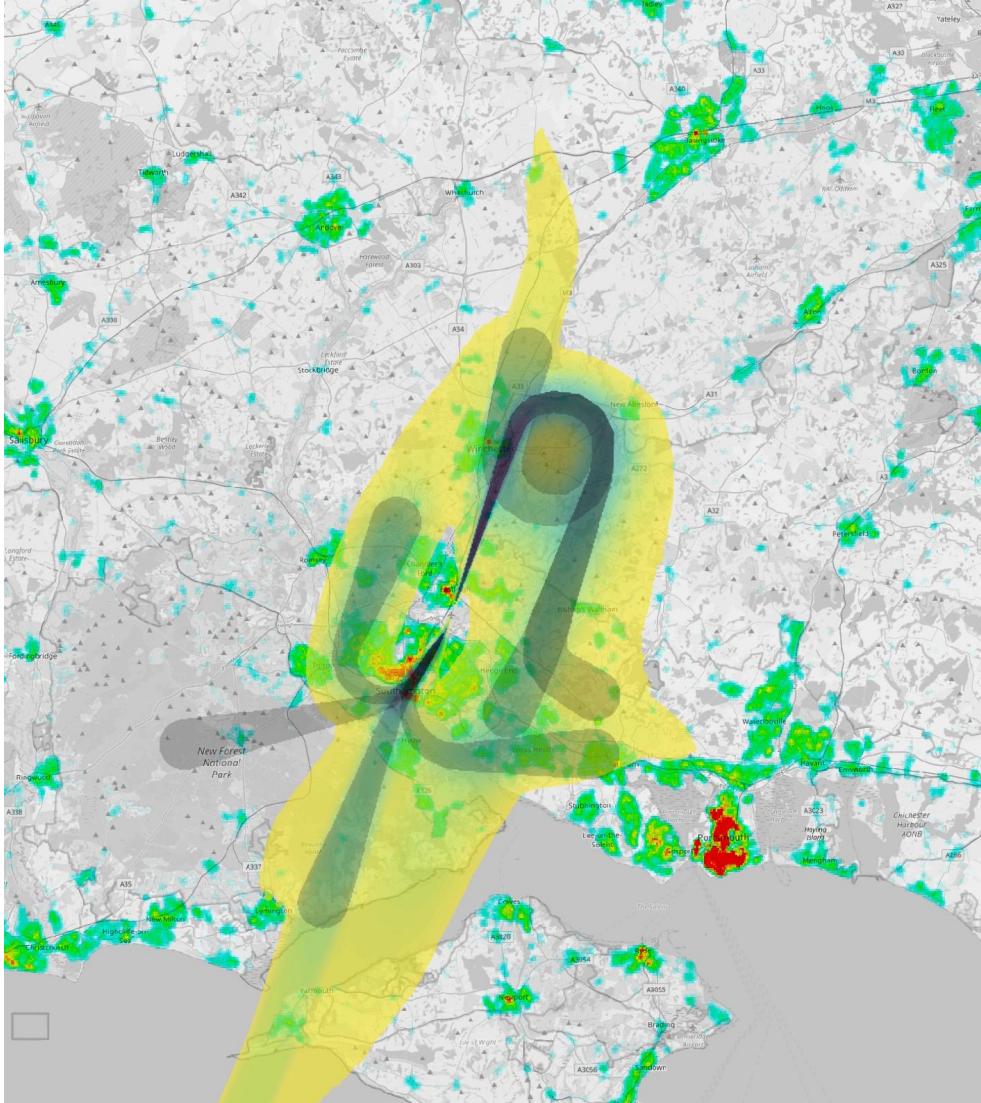

For more information around the methodology, please see our Stage 2B Initial Options Appraisal document on the [CAA's Airspace Change Portal](#).

Data within this Technical Appendix - Overview of Methodology

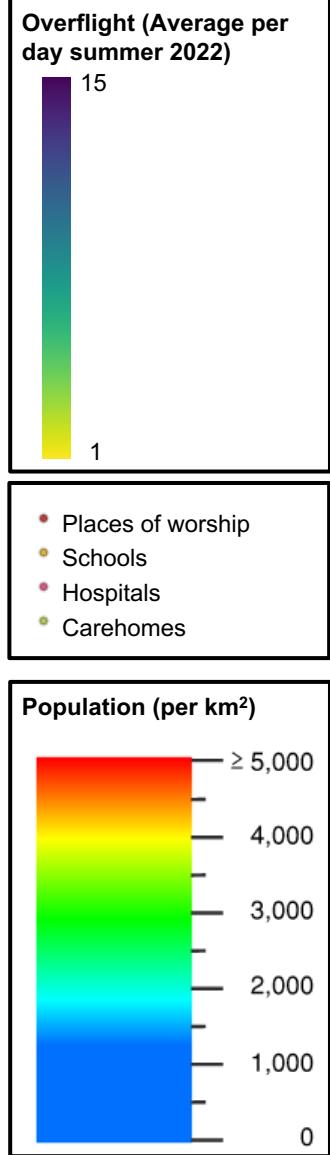

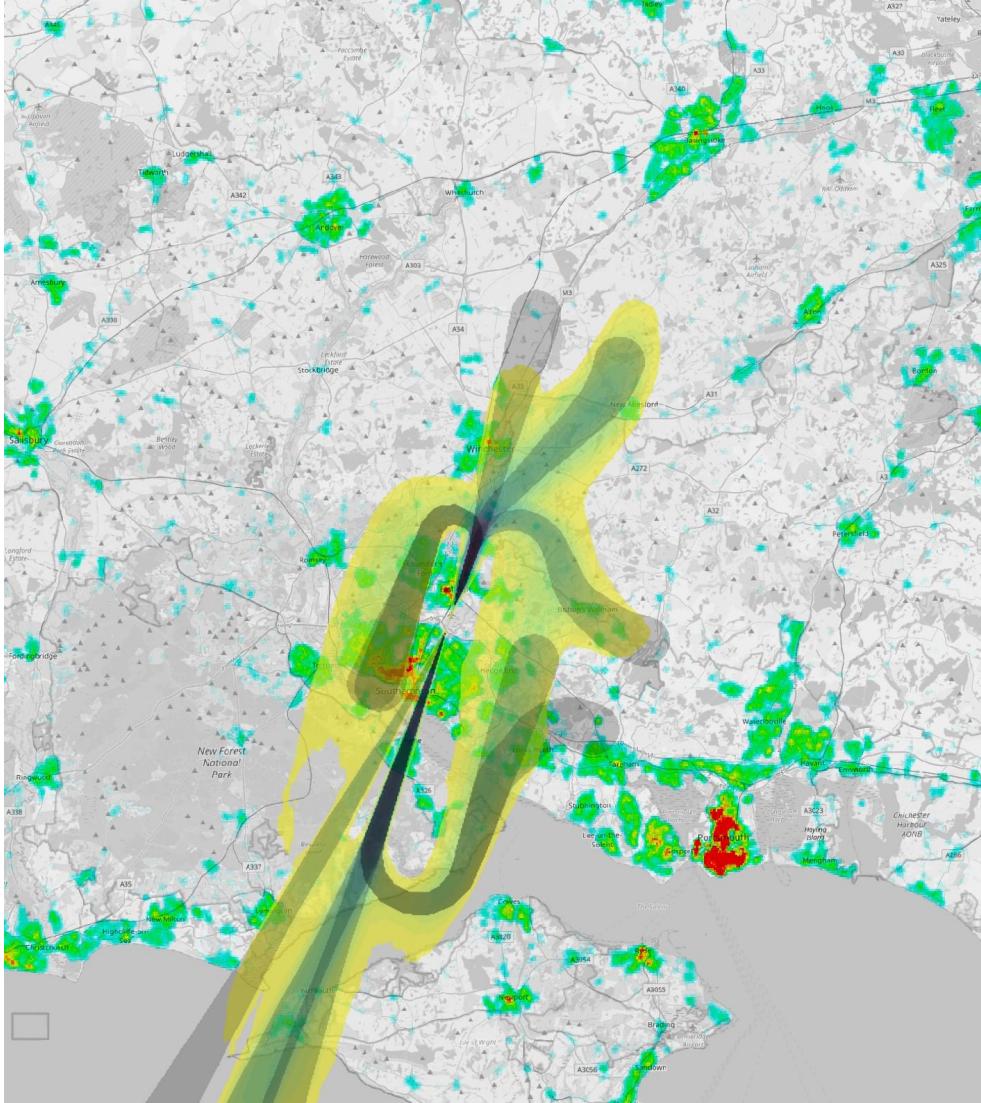

65dB L_AMax Baseline Average Centreline	65dB L_AMax Baseline and Option
<p>Baseline contour shaded grey on image Based on a single noise event i.e one departure or arrival based on the A320 profile in AEDT Only considers average centreline data (no vectoring) The data tables use 2021 CACI and point X data to identify noise sensitive sites and population. Does not consider frequency of overflight</p>	<p>Baseline contour shaded grey on image. Option contour black outline. Baseline generated as per description opposite. Option generated based on a single noise event i.e one departure or arrival based on the A320 profile in AEDT Only considers average centreline data (no vectoring) The data tables use 2021 CACI and point X data to identify noise sensitive sites and population. Does not consider frequency of overflight This assumes that all aircraft will fly the route centreline to/from 7000ft</p>
